Applicant: Coach Wei, et al U.S.S.N.: 10/017.183

Filing Date: February 19, 2003 EMC Docket No.: EMC-06-235

In the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the

Application.

Listing of Claims:

1. (Currently Amended) A method for delivering an application over a network in which

the business logic of the application is running on a backend server, the method comprising the

steps of:

having the application invoke a GUI API to present the application's user interface:

replacing the GUI API with a re-implemented, network aware GUI API running on a

backend server which translates the application's presentation layer information into pre-

determined format based messages which describe a Graphical User Interface, event processing

registries, and other related information corresponding to

the presentation layer of the application in high level, object level, messages:

sending such messages to the client device via a network;

processing the messages and rendering a user interface by a client-side program, which

delivers a user experience for that device according to the capability of the specific client device;

rendering the user interface on the client device;

transmitting a plurality of necessary user input and a plurality of client-side events back

to the server by the client-side program via a predetermined protocol:

processing the user input and client-side events on the backend server, translating the

events and inputs as if they were locally generated, and sending such translated events and inputs

to the application for processing:

Filing Date: February 19, 2003 EMC Docket No.: EMC-06-235

encoding and routing output of the application to the client device using the

predetermined messaging format; and,

further processing the output by the client-side program to refresh the Graphical User

Interface thereat;

wherein use of the re-implemented network aware API enables the application to be

developed once and deployed multiple times.

2. (Previously presented) The method of Claim 1, wherein the GUI API and the event

processing API are Java Foundation Classes.

3. (Previously presented) The method of Claim 1, wherein the client-side program is a

computer program based on an Operating System's API, such as Windows API, or X Windows

API.

4. (Previously presented) The method of Claim 1, wherein the client-side program is a

wireless device program written using the device's Operating System's API, such as Palm API

and Windows CE API.

5. (Previously presented) The method of Claim 1, wherein the client-side program is a Java

program written using a Java API.

-4-

Applicant: Coach Wei, et al U.S.S.N.: 10/017,183

Filing Date: February 19, 2003 EMC Docket No.: EMC-06-235

6. (Previously presented) The method of Claim 5, wherein the JAVA API is AWT,

Personal Java, Java 2 Micro Edition based GUI API or Java Swing.

7. (Original) The method of Claim 1, wherein the predetermined protocol is HTTP.

8. (Original) The method of Claim 1, wherein the predetermined protocol is HTTPS.

9. (Original) The method of Claim 1, wherein predetermined protocol is WAP.

10. (Original) The method of Claim 1, wherein predetermined protocol is proprietary.

11. (Previously presented) The method of Claim 1, wherein the predetermined messaging

format is based on XML.

12. (Previously presented) The method of Claim 1, wherein the predetermined messaging

format is proprietary.

13. (Original) The method of Claim 1, wherein the network is the Internet.

14. (Original) The method of Claim 1, wherein the network is a local area network.

-5-

Applicant: Coach Wei, et al U.S.S.N.: 10/017,183

Filing Date: February 19, 2003 EMC Docket No.: EMC-06-235

15. (Original) The method of Claim 8, wherein the local area network is a bandwidth-

limited slow speed network.

16. (Original) The method of Claim 1, wherein the network includes a wireless network.

17. (Previously presented) The method of Claim 11, wherein the client device is selected

from the group consisting of workstations, desktops, laptops, PDAs, wireless devices and other

edge devices.

18. (Original) The method of Claim 1, wherein the server and the client device are

combined into one entity.

19. (Cancelled)

(Cancelled)

21. (Cancelled)

22. (Currently Amended) A system for distributing an application including at least a server, at

least a client device, and a communication means, the system comprising:

a presentation layer of the application written using a server-side API based network

programming model;

-6-

Applicant: Coach Wei, et al U.S.S.N.: 10/017.183

Filing Date: February 19, 2003 EMC Docket No.: EMC-06-235

a business logic layer of the application and a data layer of the application both of which

are written with the server-side API and running on the server; and where

the server-side API having a supporting infrastructure that sends the application's

user interface information to a client device for presentation, handles communications problems,

renders the application's user interface and dispatches necessary user input events back to the

server for processing;

wherein use of the system enables the application to be developed once and deployed

multiple times.

23. (Currently Amended) An apparatus for distributing an application over a network where the

apparatus includes:

a server:

a client device:

a network communication means:

a re-implemented, network based API module that is used to transparently replace the

API on which the application was developed:

a first means for running an application of the plurality of applications where a business

logic of the application runs on the server;

a second means for replacing the API of each of the plurality of applications with the

network based API so that each of the applications' logic runs on the server;

-7-

Applicant: Coach Wei, et al U.S.S.N.: 10/017,183

Filing Date: February 19, 2003 EMC Docket No.: EMC-06-235

a third means for using the network based API to create a display for an application on

the client device;

a fourth means for transferring the user interactions on the client device to the server,

calculating the appropriate response to the input, and transmitting the appropriate response to the

client machine;

a fifth means for updating the display of the application on the client device based on the

responses from the server;

wherein use of the re-implemented network aware API enables the application to be

developed once and deployed multiple times.

24. (Previously presented) The method of Claim 1 wherein the application code is not modified

when distributing the application and the application code is not distributed to the client device.

25. (Previously presented) The method of Claim 1 used to distribute a plurality of pre-existing

applications.
